CareQueue: system architecture

Hospital Digital Token and Queue Management System · static web app, no build step · as built on 25 Oct 2026

Automated tests (tests/)

node:test, 19 unit tests → queue-core.js
Numbering, Call Next, Skip, Recall, EWT incl. the PRD's 23-minute example
Playwright, 18 browser tests → all four pages together
Display < 2 s, no names on display, sign-in and guards, phone layout

Not built (by design, for the 1.5-day hackathon)

No server and no database: the queue is shared only between tabs of one browser on one computer.
To scale: keep TokenQueue's functions, replace load/save with API calls and server push; run queue-core.js on the server unchanged.

CareQueue: entity relationship diagram

Logical model of the data CareQueue stores today. There is no database: records live in app/data.js and the browser's localStorage.
